

The OverUnity Prize

***Conditions to win the OverUnity Prize money
donated by the OverUnity.com admin Dipl.Ing. Stefan Hartmann
and some members of the OverUnity.com forum:***

Here are the conditions, that will apply to win the prize money:

1. You need to build 2 working units, both must work the same, so to make sure, it is a replicatable device. One device you must keep yourself for verification processes and the other device you must ship to me:

Stefan Hartmann, Keplerstr. 11 B, 10589 Berlin, Germany

for the testing and verification process.

2. Each devices must not weight more than 20 Kg and at least put out **1 Watt** of contineous electrical DC power.
(Voltage and current ratio does not matter, but it should be less than 1000 Volts DC for handling it more safely, so at 1000 Volts DC it should deliver at least constantly 1 mA, or at 100 Volts at least 10 mA or at 10 Volts at least 100 mA for instance)
(Please rectify and buffer with a cap, if you just only have AC power, so please convert it to DC power for easier output power measurements)
If your device is more a mechanical or chemical (e.g. rotational, electrolyis or cold fusion-type, etc.) device, you must build also into it the converter to get electrical DC power out of it, so it is producing at least a contineous

1 Watt of free electrical DC power without using any fuel other than water or air. Your device must not be powered by an outside source, such as wind, solar or received radio energy and must work 24 hours / 7 days a week / 365 days per year long.

The output power must stay constant and must not fall down after some time. It must only have a „fuel“ or „maintainance cost“ per year of less than 0.001 US\$ = 0.1 UScent PER GENERATED KILOWATTHOUR including "fuel-", repair-" and maintainance costs.

3. It can be powered by radioactive decay, but the used materials must not be harmful and must be easy to get in every city and must not be special parts which are difficult to get or hard to produce and must not be highly dangerously radioactive or unlawful to possess.

It also must not use any very expensive or forbidden and/or banned radioactive materials, which are hard to get for the average guy and are dangerous to handle and pose a threat for the environment.

Also if it used water as the "fuel", it should not use more than 1 Liter of normal tap water per day.

It also must not put out any dangerous pollution stuff and must not be harmful to the environment.

4. A maximum of 4 x 9 Volts Batteries or accumulators or a maximum of 4 pieces D-cell type batteries or accumulators can be used in it. These batteries must only be used as storage or start batteries and they must not have more than 20 Watthours (Voltage x Amphours) of energy storage capacity.

They must be declared and must not be hidden and battery lifetime and recharge time must be specified.

5. Battery life should be at least 3 years and to replace the batteries should not cost more than 5 USD for all of the batteries (if batteries are at all used in the device)

6. Patented devices do not apply, cause we want a solution that has no rights yet on it and which would be free to build by anyone. Commercial replications must pay at least 10 % license fees to charity organisations or simular organisations, that "feed the world" and help the poor. This should be watched by the community to verify that commercial builder companies really pay these licenses to charity organisations.

The inventor who wants to patent his device should not apply for the Prize.

7. The inventor will get the prize money from me, if the device works at my home and will still work after 3 months of time without dropping in output power level. 3 Months should be long enough to study and verify the unit and also do extensive tests and measurements with it and first replications would be then already available from the community.

The verification tests will be published widely all over the internet to spread quickly together with the blueprints PDF File building instructions.

8. The device should not cost more than 300 US\$ in parts- and material-costs to build and the inventor must also supply a DOC or PDF file with pictures and building instructions and an explanation how he thinks that it works. Labor costs to produce and build these units should not be higher than an additional 50 Euros or 75 US\$ per device.
9. The inventor of the devices must build the 2 devices from his own money and loan one of these devices to me (Stefan Hartmann) for the 3 months test period and after this he can choose, if he wants to get the device back or would like to sell the devices to me to keep for it for myself. (the Prize-money would be reduced then by 300 US\$ costs if the inventor wants the device back)
10. The inventor needs to ship the device on his own costs to me. If he can supply convincing videos in advance of the functioning of the device shipping charges to my address in Germany can be paid by me, if he is low on money.
11. If you have such a unit and it produces at least **1 Watt** of contineous free energy power indefinately, just put all the construction details and diagrams first into a ZIP or RAR file and post it at OverUnity.com in the OverUnity Prize category, so it is already open source, so nobody can apply for a patent anymore.
Then contact me and mail this unit to me for testing for a 3 months loan period, where it will be tested for the contineous power output.
As the blueprints are by then already posted, other people can replicate it also during this time period and can verify it for themself and help the test-process confirm or non-confirm, so the testing period before the prize is issued could also be reduced in time less than 3 months, if it is clear, that the device really puts out this power indefinately with only a maintanance cost of less or equal of 0.1 US\$cent per KWatthour.

Okay, these are the now fixed conditions to get the OverUnity Prize money. The amount of money will rise, when more members are going to donate also money into the Prize pot. The money will be hold by every single donator himself, until me (Stefan Hartmann) will publically announce the OverUnity Prize winner and then the other donators should pay also their money to the winner on their own. So I will only hold my own money reserved for the winner and do not have to handle other´s money.

Berlin, Germany on the 5th of Oktober 2008

Stefan Hartmann.
